The efficacy of acupuncture in treating urge and mixed incontinence in women: a pilot study

Conclusions: Subjects randomized to the true acupuncture group had a mean 63.30% (median = 65.99%) reduction in daytime accidents/day at 1 week postacupuncture and 67.47% reduction (median = 75.76%) at 4 weeks postacupuncture. In contrast, the mean reduction in daytime accidents was 18.88% (median = 19.64%) at 1 week and 16.67% (median = 0%) at 4 weeks post-sham acupuncture.
