Study on effect of electroacupuncture at Hegu (LI 4) on the uterotonic time in parturients of uterus inertia

Conclusions: Electroacupuncture at Hegu (LI 4) can be adopted for treatment of dystocia due to abnormality of force of labor.

Institute of Acupuncture and Moxibustion, China Academy of Chinese Medical Sciences, Beijing 100700, China.

OBJECTIVE: To evaluate the therapeutic effect and applying value of Hegu (LI 4) for inertia of uterus.

METHODS: In three centers, 276 cases enrolled were randomly assigned to a western medicine group and an acupuncture and western medicine group. The western medicine group were treated with intravenous drip of oxytocin, and the acupuncture and western medicine group were treated with electroacupuncture at Hegu (LI 4) and intravenous drip of oxytocin. Changes of inertia of uterus and duration and interval of uterine contraction were investigated in the two groups.

RESULTS: The total effective rate was 97.1% in the acupuncture group, and 70.3% in the western medicine group with a very significant difference between the two groups (P < 0.01). There was a significant difference in the duration and the interval of uterine contraction between the two groups (P < 0.01, P < 0.05).

CONCLUSION: Electroacupuncture at Hegu (LI 4) can be adopted for treatment of dystocia due to abnormality of force of labor.
